

558 vintage metal wall plates, every one **R99**, built from the 53-page PDF catalogue. Source lives in the `chevelle-mem-sales` repository under `site/ — index.html` plus `img/`, 559 files.

THE CATALOGUE

All 558 codes and names were parsed from the PDF and checked against the contents page, with no missing items across the 14 categories. The 558 embedded photos were extracted, mapped to codes by page and reading order (12 per page, 1:1), spot-checked against the printed names, and compressed to 300px WebP thumbnails at 9.6 KB each — 5.24 MB total. Only 60 render at a time, so the page opens on about 576 KB rather than the full 5.24 MB.

CATEGORY	PLATES	CATEGORY	PLATES
Beer & Cider	115	Trucks & Tractors	22
Cars & Classics	105	Route 66 & Road	17
Petrol & Motor Oil	98	Music & Bands	13
Spirits & Cocktails	60	Pin-Up & Humour	12
Garage & Tyres	45	Kitchen & Recipes	11
Motorcycles	27	Coca-Cola & Soft Drinks	6
Parking & Warning	23	Lifestyle & Americana	4

COMMERCIAL RULES

Every plate R99, flat. Delivery R99 flat per order, anywhere in South Africa (confirmed 9 August 2026).
Delivery 3–5 working days. **One delivery fee per order, never two.**

Sold plates stay visible under a semi-transparent SOLD banner and can still be added as pre-orders. Pre-order lines are priced but excluded from the payable total and listed separately in the WhatsApp message. A basket mixing in-stock and pre-order plates is **held and shipped complete** once the pre-order lands, so the single R99 covers it — the panel and the WhatsApp message both say so, and offer to split the order on request. A pre-order-only basket carries no delivery fee, because nothing ships.

Noted and overruled by decision: R99 courier on a R99 plate is a 100% uplift on a single-item order. If basket size becomes the problem, free delivery above a threshold lifts average order value without cutting the fee. The flat R99 stands unless revisited.

CONTACT AND PAYMENT

WhatsApp	064 943 7890 · 27649437890
PayShap	064 943 7890
Bank	FNB – Gold Business Account
Account	6307 4689 771
Branch	252155 (Bedford Gardens)
Account holder	Get Buzzed (Pty) Ltd t/a Club Chevelle
Card	pay.yoco.com/get-buzzed

Card is live — Yoco has no prohibited-goods issue with metal signs. The page displays Club Chevelle with the Chevelle logo, so the earlier GET BUZZED mismatch is resolved and the in-app disclaimer is gone. The app appends `?amount=&reference=`, which Yoco renders as locked text, so the card reference always equals the order reference. The same pre-filled link goes into the WhatsApp message and sits behind Copy on the Card row. A pre-order-only basket disables the card button and withholds the link.

The bare page URL is useless — on its own it opens at R0.00 with the payment sections collapsed. Never send it to a customer; every path the app offers builds the full link.
Check the amount, not just the reference. The amount is locked in Yoco's interface but travels as a URL parameter, so a customer could edit it and pay less with a valid reference. Confirm the amount received before dispatch.

ORDER REFERENCES

Format **CHEV-YYMMDD-HHMM-XXX** — date, time to the minute, then three random characters, e.g. **CHEV-260816-1302-W7W**.

The three characters exist because the reference is the only thing tying a payment back to an order: without them, two customers checking out in the same minute would share one and their payments could not be told apart. The alphabet omits B/8, I/1, O/0, S/5 and Z/2, so a reference read over the phone or typed into banking cannot come back as a different one.

ORDER CAPTURE

Every order is posted to the Netlify form `orders` as it is sent — reference, name, contact, address, total, shipping state and the full line items. They appear under **Forms → orders** in the Netlify dashboard, so a card payment can never arrive with nothing on record saying what it was for. Capture is fire-and-forget: if it fails the customer is never blocked, and the WhatsApp message still carries everything. Re-sending the same reference does not create a duplicate row.

Requires the Netlify project to be linked to the repository — Netlify detects the form at deploy time. Set `captureOrders: false` to switch it off.

MAINTAINING IT

Everything editable sits in the `BRAND` object at the top of the script in `site/index.html`: name, legal entity, WhatsApp, price, delivery fee and time, the Yoco URL and the trading name it displays, PayShap and bank details, `captureOrders`, the footnote, and `soldOut`.

- **Marking a plate sold** — add its code to `soldOut`, e.g. `soldOut: ["CC-CAR-014"]`. The SOLD banner, pre-order tag, totals split, held-shipment note and WhatsApp message all follow automatically.
- **Removing the card button** — clear `yoco` and the button, the card row and the card note all disappear.
- **The card note is derived, not hard-coded** — if `yocoName` stops matching `BRAND.name`, the app reinstates the "the page shows X, which is us" disclaimer by itself, so a rename cannot leave stale reassurance on the page.
- **Republishing** — commit to the repository and Netlify redeploys. URL unchanged. `netlify.toml` sets `X-Frame-Options: DENY` (this page shows banking details, so it must not be framable by a lookalike site), a CSP, `Referrer-Policy`, immutable caching for `img/`, and no-store for `index.html`.

VERIFICATION

`test/_verify.mjs` — 31 browser checks against the shipped site: reference format and uniqueness, the totals split, the disabled card button and withheld copy link on a pre-order-only basket, $R198 + R99 = R297$, the Yoco amount and reference matching the panel, the held-shipment copy, order capture end to end, the address requirement, and rendering with Google Fonts blocked. `test/_catalogue.mjs` checks the files on disk instead of the running page: every code has a thumbnail and every thumbnail belongs to a code. Both run on every push and pull request, so the checks no longer depend on anyone remembering them.

TO DO

BEFORE TAKING A REAL ORDER

- 1 **Register the ShapID** against 064 943 7890 in FNB banking, and send an R1 PayShap to confirm it lands. PayShap to that number fails until this is done.
- 2 **Run one live R1 card payment.** Confirm both the amount and the reference reach the Yoco dashboard, and time the payout to FNB.
- 3 **Link the Netlify project to the repository** so order capture goes live and the security headers take effect.
- 4 **Place a full test order end to end.**

SOON

- 5 **Call FNB and place a debit-order block** / DebiCheck-only instruction on account 6307 4689 771. The published account number carries the usual SA debit-order fraud exposure; this neutralises most of it in one call. Then decide separately whether the number stays on the public page — PayShap and card already cover most customers.
- 6 **Confirm typical stock depth per code.** The stepper allows 99 and `soldOut` needs a redeploy. If stock is often 1-3, the cap should drop and `soldOut` should become a per-code quantity map rather than a list.
- 7 **Verify the first and last image on each PDF page.** The photo mapping is positional, so a page with 11 or 13 extractable images would shift everything after it — and the 558/558 count check still passes in that case.

THEN

- 8 A real domain, a courier agreement, and an offsite copy — the last of which the repository now provides.
